In recent years, I've been struggling to find an answer to a question posed to me by a friend. If you are arrested for a crime and are in a very difficult type of prison, you are subjected to beatings, starvation, and torture, some of which can cause permanent damage. How could one avoid being caught or escape if they were not to use violence to do so? A: There are two answers to this. The first is that if you are in such a place, you might as well be killed rather than live. There are various non-violent methods of killing, some of which might be effective in a particular prison. A good book about torture and killing is Effective Weapons by R. Harry Rooks. There's also this concept of "killing time", which can be used in a prison to slow the passage of time. Q: How to display large data in the web page, I would like to display large data in a web page, but not much of the page is visible. I need to display data in tabular format. The total number of rows or columns in a table is very large but the data in each rows or columns is too short to be displayed using any of the modern HTML tags such as ul, list, table, blockquote, block I would like to maintain the structure of the HTML page. I am looking for some kind of special HTML tags or some special HTML properties such as wordwrap, word-break that would enable me to display the whole data with just a single line. Or Can you suggest any special algorithms such as BFS or DFS that would allow me to do it? Thanks, Amir A: Wordwrap in HTML5 provides a way to get the job done. Some links: Paging and Displaying Large Browsable Datasets using HTML5 Working with large datasets in HTML A: You can use JavaScript. I've never done this myself but I saw an example from ten years back and it should work: The div.container holds the whole dataset. The div.overview is a container for the overview. f678ea9f9e
